## PREFACE

*The quarterly economic accounts are an integral part of the system of national accounts, comprising a coherent set of transactions, accounts and balancing items. They form a consistent set of indicators that are rapidly available and provide an overall picture of recent economic activity. The quarterly accounts thus supply the basis for cyclical analysis of the economy.*

*The purpose of this publication is to provide a picture of trends in the economic cycle of the European Union as a whole, the Member States and its major trading partners. This picture is set in the international economic context and provides an overview of the short-term trends of the main economic indicators. The data are taken from the quarterly national accounts of each Member State that compiles such accounts and are harmonised so that the various economic situations can in fact be compared.*

*Every three months there is a special report on one particular aspect of the accounts, and certain aspects or topics that merit further analysis are highlighted.*

*It is Eurostat's hope that with this publication it can provide a more comprehensive response to the growing demand from users for quarterly national accounts data, with data relating to the main aggregates in the national accounts presented in a clear and organised manner.*

# 1. Introduction

## GENERAL ECONOMIC SITUATION

Eurostat estimates<sup>1</sup> concerning first quarter 2002 point out a 0.3% resumption of Gross Domestic Product (GDP) in both the euro-zone<sup>2</sup> and the European Union (EU15), after reducing by 0.2% in both areas during the previous quarter.

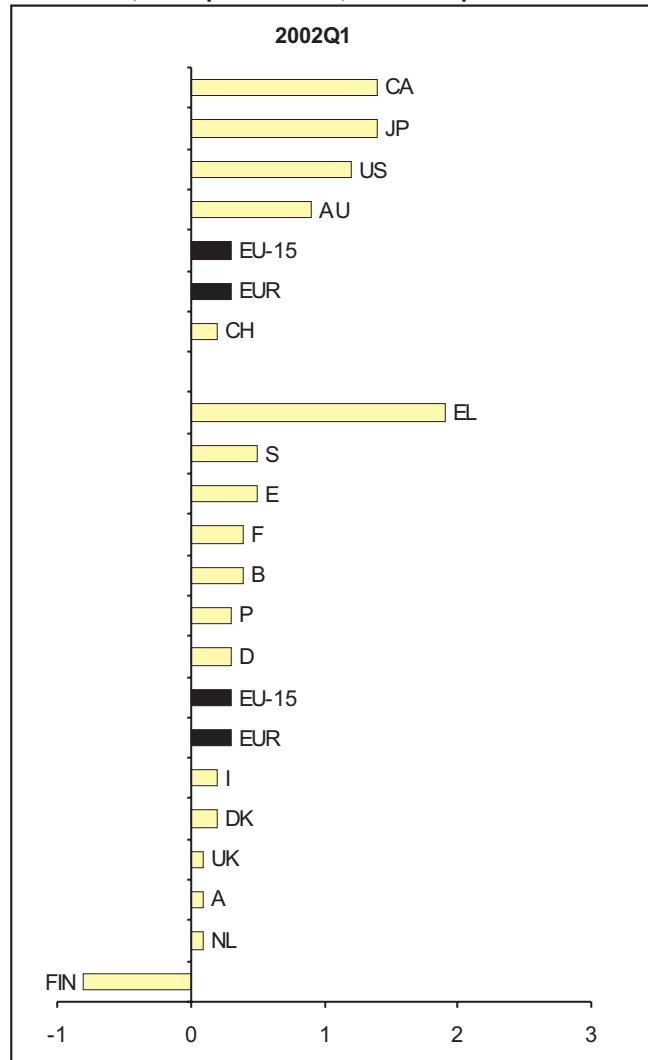

These results may be explained mainly by an extremely weak growth of final household and NPISHs' consumption (0.0 and 0.1 of GDP variation, respectively), a recrudescence of a persistent fall in investments (- 0.1 and - 0.2 of GDP variation, respectively), nevertheless associated to exports' resumption (0.3 and 0.2 of GDP variation, respectively) and reduction of imports' decline (0.2 and 0.1 of GDP variation, respectively).

With regard to the main partners of the European Union, the growth of the United States' GDP accelerated, reaching 1.2% in the first quarter 2002, following the previous quarter's resumption (+ 0.7%). A 1.4% recovery was observed in Japan – after a 1.2% fall during the previous quarter – as well as acceleration in Switzerland (+ 0.2%).

Compared to first quarter 2001, the euro-zone and the EU15 GDP increased by 0.3% and 0.4%, respectively, the United States' by 1.4%. A 1.6% GDP decrease was observed in Japan.

During first quarter 2002, the economy of the EU Member States recorded a rather positive development. GDP growth accelerated in Denmark (+ 0.2%), in Greece (+ 1.9%), in Spain (+ 0.5%) and in Sweden (+ 0.5%), also recovering in Belgium (+ 0.4%), in Germany (+ 0.3%), in France (+ 0.4%), in Italy (+ 0.2%), in the Netherlands (+ 0.1%) and in Austria (+ 0.1%). GDP growth kept stable at 0.1% in the United Kingdom. On the other hand, it slowed in Portugal (+ 0.3%), and worsened compared with the previous quarter's fall in Finland (- 0.8%).

**Figure 1.1. Gross domestic product, quarterly growth rates T/T-1, first quarter 2002, constant prices 1995**

Data for Ireland, Luxembourg, Iceland and Norway are not available.

<sup>1</sup> Methodological note: data for EUR and EU-15 are calculated according to a statistical framework which is coherent and consistent at the same time, using as indicators the data of all the Member States compiling quarterly accounts. Aggregations for EUR and EU-15 were carried out using the seasonally adjusted data of the Member States. These data are also corrected for working days for Germany, Spain, France, the Netherlands and the United Kingdom.

<sup>2</sup> The euro-zone consists of Belgium, Germany, Greece (since 01.01.2001), Spain, France, Ireland, Italy, Luxembourg, the Netherlands, Austria, Portugal and Finland.

## Total expenditure of final consumption of the households and the NPISHs

Final consumption expenditure of households and NPISHs (non-profit-making institutions serving households) stagnated in the euro-zone and its growth slowed to 0.1% in the EU15. However, it reduced speed also in the United States (+ 0.8% compared to + 1.5% during the previous quarter) and in Japan (+ 1.6% compared to + 1.9%).

The final consumption expenditure of the households and NPISHs (FCEH) showed a rather negative drive in the EU Member States, recording the highest growth rate in Denmark, with a + 1.3% acceleration, and the strongest fall in Germany, with – 0.6%.

## Final consumption expenditure of the Public administrations

The growth of Government final consumption expenditure (FCEG) during first quarter 2002 remained stable at 0.6% in the euro-zone and at 0.8% in the EU15. FCEG growth slowed to 1.0% in the United States (+ 1.7%

during the previous quarter), recording however strong acceleration in Japan (+ 1.2%).

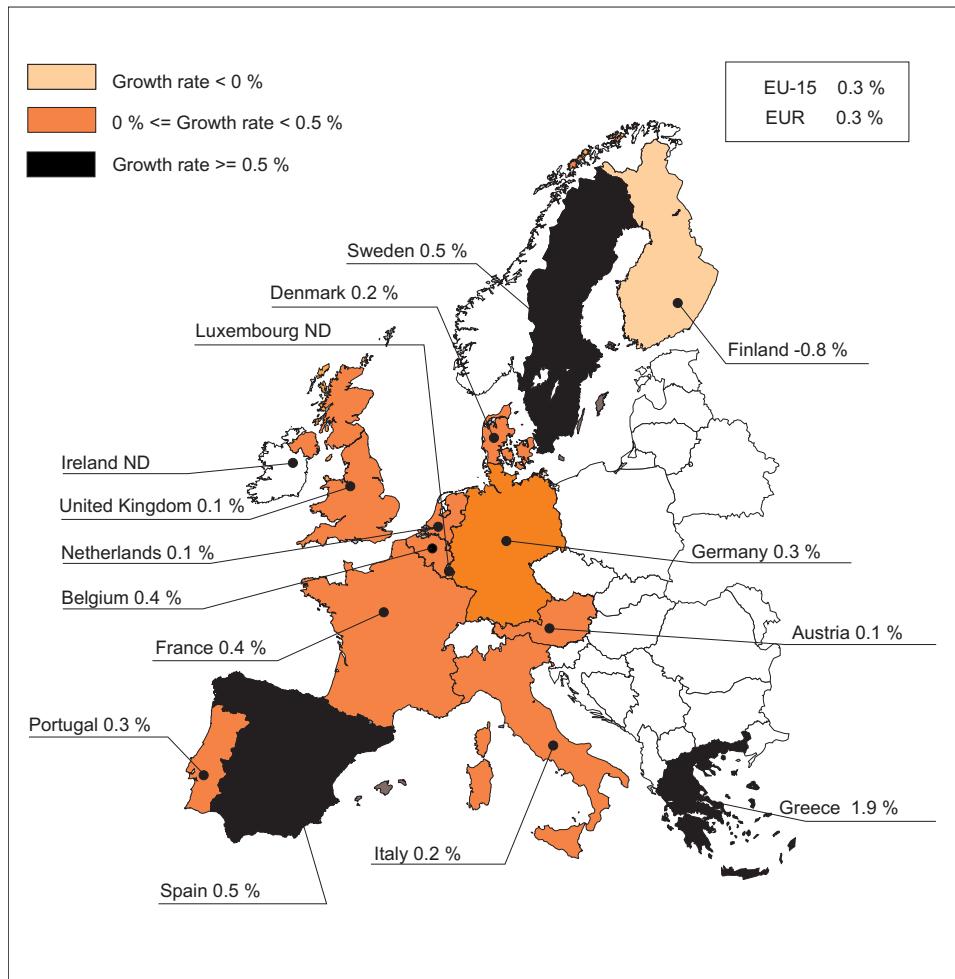

Among the EU Member States, the strongest FCEG growth was noticed in the United Kingdom, with a + 2.0% acceleration. The one and only reduction was observed in Denmark (– 0.2%).

## Gross fixed capital formation

Gross fixed capital formation (GFCF), compared to the previous quarter, continued keeping negative with – 0.5% in the euro-zone, passing in addition from – 0.3% to – 0.9% in the EU15. Investments posted recovery in the United States (+ 0.4% compared to – 1.0%), while a strong reduction of the previous quarter's decline was noticed in Japan (– 1.2% compared to – 8.2%)

The growth of Gross fixed capital formation (GFCF) showed a predominantly negative trend in the EU Member States. The most remarkable fall in investments was recorded in Sweden, with an 8.9% drop, followed by Portugal (– 6.8%) and Denmark (– 5.0%). GFCF growth reached its top in Belgium (+ 1.0%) .

**Map 1.1. Quarterly growth rates of GDP, 2002Q1 (in %)**

## Domestic demand

During first quarter 2002, domestic demand went through a 0.2% fall of in the euro-zone (+ 0.3% during the previous quarter), however remaining stable at – 0.1% in the EU15 for the third consecutive quarter. Among the main economic partners of the European Union, domestic demand growth accelerated in the United States (+ 1.4% compared to + 0.7%), recovering in Japan (+ 0.8% compared to – 1.2%).

Concerning the EU Member States, domestic demand growth topped in Greece, with strong acceleration (+ 2.0% compared to + 0.0% in the previous quarter). On the contrary, the most severe reduction in domestic demand was noticed in Austria (– 2.2%), followed by Germany (– 0.8%) and Denmark (– 0.7%).

## International exchanges

The commercial surplus of the euro-zone, expressed as a percentage of GDP, increased in first quarter 2002 (+ 3.1% of GDP compared to + 2.6% in the previous quarter), because of a resumption of exports (+ 0.8% compared to – 1.4%), together with an attenuation of imports' fall (– 0.6% compared to – 1.5%). With regard to the EU15, commercial surplus increased (+ 2.0% of GDP compared to + 1.6%) for the same reasons: exports' resumption (+ 0.6% of GDP compared to – 1.3%), reduction of imports' fall (– 0.3% of GDP compared to – 1.1%).

In the United States, the trade deficit worsened (– 5.0% of GDP compared to – 4.8% in the previous quarter), because exports' resumption (+ 0.9% of GDP compared to – 2.5%) was definitely weaker than imports' (+ 2.1% of GDP compared to – 1.3%). Japan's commercial surplus increased (+ 2.4% of GDP).

With regard to the EU Member States, the commercial surplus, expressed as a percentage of GDP, reached the highest level in Finland and Sweden (+ 12.6% and 10.4% of GDP, respectively). Conversely, the most prominent trade deficit was recorded in Portugal –although reducing (– 8.9% of GDP), followed by Greece (– 8.4% of GDP) and the United Kingdom (– 7.2% of GDP).

## GDP by branch

The growth of Agriculture's value added slowed both in the euro-zone and the EU15 during the first quarter 2002 (+ 0.1% compared with + 0.2% during the previous quarter). Among the EU Member States, Finland recorded the most remarkable increase, with a + 4.6% resumption, followed by Portugal with + 4.2%. The most notable fall was observed in Spain, with – 3.5%, followed by the Netherlands with – 2.2%.

The growth of Industry's value added posted a 0.8% and 0.5% resumption in the euro-zone and in the EU15, respectively (– 1.9% for both during the previous

quarter). Among the EU Member States, the most severe cutback occurred in Finland (– 2.8%), followed by Denmark (– 2.2%). The strongest recovery was observed in Austria (+ 3.3%), followed by Belgium (+ 1.7%), Germany and Finland (+ 1.3% for both).

GVA development of the Construction branch accelerated both in the euro-zone and in the EU15, reaching + 0.7% and 0.9%, respectively, compared with + 0.0% and + 0.2% during the previous quarter. Among the EU Member States, the strongest acceleration of GVA growth for Construction was observed in the United Kingdom (+ 3.0%), followed by Finland and Belgium (+ 2.4% for both). The most significant fall was recorded in Portugal (– 3.9%) and in Austria (– 2.5%).

GVA growth rate for the Trade, transport and communications branch kept stable at 0.2% in the euro-zone and reached 0.3% in the EU15. With regard to the EU Member States, the fastest development was recorded in Portugal (+ 1.5%) and Denmark (+ 1.3%); conversely, the most conspicuous decline occurred in Italy (– 0.5%). Financial activities and business services' GVA accelerated its growth in the euro-zone (+ 0.5% compared with + 0.4% during the previous quarter), although slowing in the EU15 (+ 0.4% compared with + 0.5%). Among the EU Member States, the most severe fall was observed in Finland (– 2.0%) and Austria (– 1.6%). Conversely the strongest acceleration was noticed in Portugal (+ 1.5%), Spain (+ 1.3%) and Denmark (+ 1.2%).

With regard to the Other service activities branch, GVA growth accelerated in the euro-zone, reaching + 0.3%, keeping stable at this same rate in the EU15. Among the EU Member States, the strongest acceleration of the GVA growth was recorded in the Netherlands (+ 1.2%) and Belgium (+ 0.8%). However, the only cutbacks were observed in Finland (– 0.3%) and Portugal (– 0.1%).

## GDP by category of income

Gross operating surplus and mixed income, at current prices, increased by 0.9% in the euro-zone and by 1.3% in the EU15 during first quarter 2002, compared to the previous quarter. The strongest acceleration was recorded in Finland (13.5%), whereas the only fall was noticed in Italy (– 0.2%).

Compensation of employees, at current prices, grew by 1.1% in the euro-zone and by 1.4% in the EU15 during first quarter 2002, compared to the previous quarter. The strongest increase was recorded in the United Kingdom (+ 2.2%), and the only reduction in Austria (– 1.0%).

Gross national income at market prices (GNI) increased by 0.1% in the euro-zone and by 0.8% in the EU15 during first quarter 2002. The strongest growth was recorded in Austria (+ 1.5%), whereas a fall was recorded in Germany and Portugal (– 0.1% for both).

### Trend in prices and exchange rates

Development of GDP implicit deflator showed acceleration of price dynamics in the euro-zone (+ 0.8% compared to + 0.7% in the previous quarter), more notable in the EU15 (+ 1.2% compared to + 0.8%). With regard to the main partners of the European Union, inflation, expressed in national currency, posted a

recovery in the United States (+ 0.3%), while prices' fall passed from – 0.1% to – 0.3% in Japan.

With regard to the EU Member States, inflation in national currency, compared to the previous quarter, reached the highest level in the United Kingdom (+ 1.7%), whereas prices dropped the most in Portugal (– 0.9%).

## 6. Quarterly Report

### Purchasing Power Parities

#### Introduction

The international comparison of economic data expressed in national currency implies the use of a common unit. One may think that the natural candidate for this role are market exchange rates. Nevertheless, when measuring and comparing Gross Domestic Product (GDP) the use of the exchange rates is not appropriate for many purposes. Indeed, the differences among countries in values of GDP expenditure correspond not only to a "volume of goods and services" component but also to a "level of prices" component, which can sometimes assume sizeable proportions. Exchange rates reflect many factors related to demand and supply in the currency markets, like, for example, the international trade and interest rate differentials, that go beyond the international direct price comparisons that are required to make volume comparisons.

To obtain a pure comparison of volumes, it is then essential to use special conversion rates (spatial deflators) which remove the effect of price level differences between countries. Purchasing Power Parities (PPPs) are such currency conversion rates that convert economic indicators expressed in national currencies to an artificial common currency, called Purchasing Power Standard (PPS), that equalises the purchasing power of different national currencies. In other words, PPPs are used to convert nominal final expenditures on product groups, national accounts aggregates and GDP of different countries into comparable pure expenditure volumes.

#### What are PPPs and how are they calculated?

In their simplest form, PPPs are a set of price relatives, which show the ratio of the prices in national currency of the same good or service in different countries (e.g. a loaf of bread costs 1.87 euro in France, 1.68 euro in Germany, 95 pence in the UK, etc). Eurostat's PPPs, however, are not only calculated for individual products, they are also calculated for products groups and for each of the various levels of aggregation up to and including GDP.

For the price collections, a basket of comparable goods and services is used which are selected to represent the whole range of goods and services, and to be representative of consumption patterns in the various countries (see Box 1).

The calculation of PPPs is undertaken in three stages: first, at the product level, then, at the product group level, where the price relatives are averaged to obtain unweighted PPPs for the group. Finally, at the aggregation levels, the PPPs are weighted and averaged. The weights used in this last stage are the expenditures on the product groups (national accounts sources).

To fix a numéraire for the numerical procedure of the PPP calculation, usually one country is used as a base country and set to equal 1. For the European Union the selection of a single country (currency) as a base seemed inappropriate. Therefore, PPS is the artificial common reference currency unit used in the European Union to express the volume of economic aggregates for the purpose of spatial comparisons in real terms. Economic volume aggregates in PPS are obtained by dividing their original value in national currency units by the respective PPPs. 1 PPS, therefore, buys the same given average volume of goods and services in all countries, whereas different amounts of national currency units are needed to buy this volume of goods and services, depending on the national price level

PPPs are spatial price and currency converters. As well-known from temporal price comparisons, these type of comparisons face the problem of changing products and consumption patterns over time. PPP price surveys, quite similarly, face the problem of selecting products that are truly comparable across countries and of comparing countries with sometimes very different economies and geographically, economically and culturally defined different expenditure structures. Goods and services that are representative of the expenditure structure in one country may be not necessarily representative in another country, and yet common ground has to be found to make meaningful comparisons. In the Eurostat comparison, this is done in a well defined process of establishment of item list (see Box 4).

#### Box 1: The International Comparison Programme

Eurostat participates in the "International Comparison Programme" (ICP), which has been running for 30 years. In Europe, Eurostat and the OECD co-operate in the framework of the "European comparison programme" (ECP), in which Eurostat annually establishes PPPs for the 15 EU Member States, the 13 EU Candidate Countries and three EFTA countries, Norway, Iceland and Switzerland. A rolling 3-year survey cycle is used for consumer prices. About one third of the consumer goods is surveyed every year, and for the remaining two thirds, suitable consumer price indices are used for extrapolation in the intervening years. Capital goods prices, rents, and GDP weights are collected annually, as well as salaries in the government sector, which are used as proxy-PPPs for the respective part of this sector. For the remaining OECD member countries, the OECD follows the Eurostat survey cycle for consumer prices, whereas a benchmark-extrapolation approach is used for the other components, with PPP calculations every third year.

## Box 2: PPPs and PPS

### • PPPs : Purchasing Power Parities

PPPs are special currency conversion rates (spatial deflators) which remove the effect of price level differences between countries. They convert economic indicators expressed in national currencies to an artificial common currency, called Purchasing Power Standard (PPS)

### • PPS: Purchasing Power Standards

PPS is the artificial common reference currency unit used in the European Union to express the volume of economic aggregates for the purpose of spatial comparisons in such a way that price level differences between countries are eliminated. Economic volume aggregates in PPS are obtained by dividing their original value in national currency units by the respective PPP.

## Box 3: Availability and extrapolation of PPPs

PPPs are available with a certain delay with respect to the reference year. The first release of the preliminary results for PPPs for the year T are now available at T + 18 months. From the reference year 2001 they will be available with a delay of T + 12. The final results are available at T + 24 months. When publishing figures for GDP per head in PPS, PPPs for the more recent years are extrapolated using implicit price deflators, normally derived from GDP or domestic final use.

## Who uses PPPs?

PPPs are constructed for international comparisons. The main and natural users of PPPs are international organisations, such as Eurostat, the OECD, the International Monetary Fund, the United Nations and the World Bank. From an historical point of view, these users initiated the process of calculation of PPPs and were their first users.

Nevertheless, PPPs are today input for many other users: other international organisations, government agencies, research institutes and the media. Their use of PPPs is mainly devoted to economic research and policy analysis requiring comparisons among countries.

One of the particularly important uses of PPPs is for the European Commission to establish both the list of regions that could benefit from the EU Structural Funds as well as the amount of funds to be allocated to each region. One criterion for allocating these funds is based on PPP-converted GDP per head being less than 75 %

## Box 4: How are PPP consumer price surveys organised?

For the purposes of the price collection for private household consumption, the 31 participating countries are divided in three groups that are organised as follows:

- the "Northern" group is composed by Finland (group leader), Denmark, Sweden, Iceland, Norway, UK, Ireland, Estonia, Latvia and Lithuania;
- the "Central" group is composed by Austria (group leader), Germany, Switzerland, the Netherlands, Belgium, Luxembourg, the Czech Republic, Hungary, Poland, Slovakia and Slovenia;
- the "Southern" group is composed by Italy (group leader), France, Spain, Portugal, Greece, Cyprus, Bulgaria, Malta, Romania and Turkey.

The idea behind this approach is to combine countries in a group with similar market structures and consumption pattern due to their similar geographical location. Subsequently, each group of countries has group-specific product lists. Specific meetings in all three groups and one so-called « overlap » meeting are organised in order to ensure a harmonised approach to the survey concerned in all participating countries, the right balance between comparability of products selected for the survey and their representativity of the expenditure pattern in each participating country and sufficient overlap between the three group product lists for the overall European comparison. A particular difficult problem in this process is the sufficient overlap between EU Member States and Candidate Countries, as the state of economic development for some Candidate Countries still lags remarkably behind the EU average. The three group leaders support Eurostat in its overall co-ordinating work.

of the EU average. The aim of the Structural Funds is to gradually reduce economic disparities between and within EU Member States.

## GDP per head in PPS

One of the most frequent uses of PPPs is in the computation of GDP and GDP per head in pure volume terms across countries. GDP per head is one of the most frequently used indicators for comparing the economic well-being of countries, despite of its statistical limits.

Table 1 shows the per capita GDP volume indices. Such indices are calculated as real expenditure volumes (expenditure values in national currency, converted using PPPs) in per capita terms, expressed in relation to the European Union average. Data for 2000 are preliminary and should, therefore, be interpreted with caution,

as they are subject to revision. The final data for 2000 will be published in December 2002.

These indices are not intended to rank countries strictly (see Box 4). In fact, they only provide an indication of the comparative order of magnitude of the per capita GDP volumes in one country in relation to others. It is therefore preferable to use these indices only for dividing countries into groups of a comparable level. The 2000 preliminary results give rise to the following groups of countries :

- Group I ( 125% of the EU average) : Norway and Luxembourg ;
- Group II ( 110% and <125% of the EU average): the Netherlands, Austria, Iceland, Ireland, Denmark and Switzerland ;
- Group III ( 90% and <110% of the EU average, i.e. close to the EU average): United Kingdom, France, Sweden, Finland, Germany, Italy and Belgium ;
- Group IV ( 75% - threshold for the Structural Funds<sup>(1)</sup> - and <90% of the EU average): Cyprus and Spain ;
- Group V ( 50% and <75% of the EU average): Hungary, Czech Republic, Greece, Slovenia and Portugal ;
- Group VI (<50% of the EU average): Romania, Turkey, Bulgaria, Latvia, Lithuania, Estonia, Poland and Slovakia.

#### PPPs and euro

The physical introduction of the euro in the euro-zone Member States ensures a first direct immediate possibility of comparing prices of the same item between countries. Nevertheless, such a possibility does not remove the effect of price level differences between countries when one tries to compare pure volumes of economic indicators. Moreover, even if technically speaking the direct comparison of prices is easier after the introduction of the euro as a single currency, the meaningfulness of such a comparison is highly affected by the different price structures of the countries when one tries to look at average prices for aggregated product groups. The latter problem may improve over time with the possible long-term effects of the euro in terms of convergence of prices and price structures. The use of PPPs, however, will stay the only valid solution for making a meaningful volume comparison across space for which price level differences have to be removed.

With the physical introduction of the euro, there is an official Eurostat-wide decision to express historic nominal national currency time series of the euro-zone countries in euro, using the fixed euro exchange rates as of 1 January 1999 (1 January 2001 for Greece). Data for non-members of the euro-zone will continue to be expressed in their national currencies.

#### Box 5 : GDP per head in PPS and country groups

When countries are clustered around a very narrow range of outcomes, it may be misleading to use the per capita volume index based on PPPs to establish a strict order of ranking. The level of uncertainty associated to the statistical information related to data sources and procedures used for compiling PPPs can affect the minor differences in the measured GDP per head and result in a different country order that may not be statistically or economically significant.

For this reason, Eurostat and other international organisations prefer to present the GDP per head results according to country groups (six in the case of Eurostat).

The consequence of this approach taken with regard to national currency time series for the presentation of PPPs and related indicators in Eurostat publications and the dissemination databases is the following :

- **PPPs**

The value of GDP and other aggregates expressed in the national currencies of the euro-zone countries have been re-scaled to 'fixed euro' by dividing with the euro conversion rates as of 1 January 1999 (1 January 2001 for Greece). The same is done with the PPP.

- **Purchasing Power Standards (PPS)**

Consequently, as the same mathematical operation is done with GDP (and all other aggregates) and PPP's, the GDP (and all other aggregates) in PPS remain unchanged, and so do the relative positions of countries with regard to GDP per head in PPS.

- **Price level index (PLI)**

The price level index is the PPP divided by the exchange rate. It is also unaffected by restating historic time series in euro. To achieve this, the market exchange rates of the euro-zone countries have been corrected in the same way as the PPP, by dividing with the euro conversion rates as of 1 January 1999 (1 January 2001 for Greece).

<sup>1</sup> Percentage of GDP

## Methodological note

This publication provides data on the main aggregates of the quarterly accounts of the European Union as a whole (EU-15), the Member States participating in Economic and Monetary Union (EUR), the Member States that compile quarterly accounts, the main non-European economic partners and the EFTA countries.

These aggregates are shown as levels (in current euro prices and in 1995 constant prices) and as exchange rates, to which are added the main deflators derived from the series in national currency.

### Accounting aspects

Quarterly national accounts data are generally estimated by the National Statistical Institutes, except in Austria, where they come from the Österreichisches Institut für Wirtschaftsforschung, in Belgium, where they are compiled by the Banque Nationale de Belgique, and Switzerland, where they come from the Office fédéral du développement économique et de l'emploi (Services des questions économiques et conjoncturelles). The national quarterly data coming from the Member States, as well as those coming from the EFTA countries, are estimated according to national accounts systems, which are compatible with the principles of the ESA 95.

There are, however, some differences, particularly with regard to the total for the Union, where exports and imports include both extra-EU and intra-EU trade. On the other hand, the Union's trade balance tallies with the other aggregates.

The United Kingdom, France, Italy and the Netherlands produce rapid estimates of the main quarterly accounts aggregates, while Finland calculates a monthly estimate of GDP.

### Methodology

The countries apply different estimating methods which fall into two main types of approach: the direct approach and the mathematical and statistical approach.

The direct approach involves conducting surveys, sometimes on a smaller scale, which reproduce the calculation of the annual aggregates. The United States, Canada, the United Kingdom and to some extent Germany are among the countries which use this approach, which requires a highly developed and efficient information system.

The mathematical-statistical approach mainly involves extrapolating quarterly data by means of reference indicators or estimating quarterly data from annual data, on the basis of a multiple linear regression model, using

reference indicators available both annually and quarterly. The main differences in the methods used relate to the form which the disturbance term of the statistical models may take. France, Italy, Portugal, Switzerland, Spain and the Netherlands are among the countries which have adopted this approach.

Although this classification may seem rigid, in practice the direct method is often supplemented by indirect methods in order to fill in the gaps or make up for late information, and conversely the indirect method is often supplemented by direct elements (e.g. on the basis of data from general government accounts, the accounts of major companies, etc.)

Some Member States, in particular the Netherlands and Denmark, compile quarterly data in input-output tables.

### Seasonal adjustment

The procedures used to adjust for seasonal variations are mostly variants of the X-11 procedure, whereby the main difference is whether or not ARIMA extrapolation is applied before seasonal adjustment. Only Austria, Spain and Italy use different methods. Spain (airline model), Italy and Austria (Tramo/Seats) use a method based on the canonical decomposition of an ARIMA model. If a country sends its series partly or entirely in raw form, they are seasonally adjusted by Eurostat using the X-12 RegARIMA method for calculating EUR and EU-15 figures. In some countries, the procedures used to adjust for seasonal variations include a correction for working days. This is the case for Belgium, Germany, Spain, France, the Netherlands and the United Kingdoms.
